

Multifunctional control with day-latch function set via radio signal

Description

FUHR extends the programme of the multifunctional controls with a version that can activate the day-latch function and/or the permanent-open-function via radio signal.

Until now a realisation of the day-latch function or the permanent-open-function was available over wired external buttons, or buttons that were integrated in the control. Thanks to the new control-firmware this can now also be set wireless via radio. With a simple touch of a button via radio keys or also with other radio access controls, like for instance FUHR fingerprint scanner. With SmartConnect easy the desired function can be controlled particularly comfortable via app – even automated with stored time profiles.

With the set function the LEDs on the control provide information with help of different flashing signals.

Day-latch via radio

Application example

Entrance doors to medical practices, shops, or small business objects have special demands regarding the opening hours and the corresponding control of access. Therefore the motorised lock **multitronic 881** allows, among other things, the realisation of intelligent locking options, like for instance to stop the complete locking temporarily.

For this purpose, two optional functions are available. With the day-latch function the door is only secured with the latch during the day. Ideally for heavily frequented doors where only controlled access is meant to happen. With the permanent-open-function, the latch and all bolts are permanently retracted. This way an unhindered opening of the door from both sides can take place without access control.

Date/market launch

The new function will be set by default in all **multitronic**-controls from July 2019.
